

# Looking for a fresh approach to data modeling?

One that is fast, simple and robust.

One that has a clean interface  
and no clutter.

The best kept secret is out!

ModelRight is one of the most valuable and affordable database design products on the market. You'll find it offers more functionality than the leading data modeling tools. Visit our website and find out why companies have switched to ModelRight!

No matter what your database, ModelRight provides all of the features that you expect and more. ModelRight is the answer when you need a database modeling tool that surpasses the “least common denominator” approach taken by others.

## Top 10 Differentiators

- ❏ **Diagramming** – the most fundamental part of your design process is your Diagram - the picture of your database. ModelRight provides unparalleled levels of control and flexibility when it comes to your Diagram's display.
- ❏ **In-Depth Database Support** – ModelRight supports all the usual database objects like Table, View, Index, Constraint (PK, FK, UK), BUT ModelRight takes a step further and provides detailed, structured support for database specific features.
- ❏ **User Interface** – Simply select the object you want to edit and then change its properties in the Property Browser. There's no need to constantly pop up dialogs to make changes.
- ❏ **Domains** – Provides an effective way to classify your objects, organize properties, enforce consistency of property values, and easily make changes across the class of objects. Other products might define something like a Column Domain, but only ModelRight extends this capability to many other types of objects - like Tables, Relations, Indexes, Diagrams, Graphical settings, Tablespace, etc.
- ❏ **Explorer Lists** – An “Explorer List” is just a list of some type of object - like Tables. However with ModelRight, you can also create a list of secondary (tertiary, etc) level objects - like Key Constraints. At each level, you can include all objects or restrict them by specifying a “Filter”.
- ❏ **Auto Revision Notes** – Automatically add a “revision note” containing a timestamp and description whenever an object is changed. It's up to you to then add a reason for the change.
- ❏ **Transaction Summary/Impact Analysis** – Whenever you make a change, ModelRight uses an internal “transaction” to contain the full impact of your change. When the transaction completes, it evaluates all of these changes and inserts an entry in this list so that you can see and report on the full impact of your change.
- ❏ **User-Defined Hyperlinks** – Define your own web-like hyperlinks on any model object. Keyboard shortcuts can then be used to quickly navigate to another model object, a file or a website. Links that are defined on Text and Image graphics work just like a web browser hyperlink - you can navigate to the link's target just by clicking on the Text or Image Graphic. ModelRight also provides hyperlinks on Property Pages to let you navigate to and create related objects.
- ❏ **Reverse Engineer into Model** – Collect information about your existing database and easily create a new Model. Quick and efficient - saving time.
- ❏ **Unbeatable Affordability** – ModelRight is one of the most affordable database design products on the market. ModelRight's unique features reflect our superior internal framework, attention to detail, and responsiveness to feature requests. They emphasize how ModelRight lives up to its motto: **Data Modeling Done Right!**
